Virtual namespace functions (VNFs) are introduced as C++ functions defined at global or namespace scope which can be redefined similar to virtual member functions. Even though this is a relatively simple concept, hardly more complex than ordinary C functions, it is shown that VNFs subsume object-oriented single, multiple, and predicate-based method dispatch as well as aspect-oriented before, after, and around advice. Their implementation by means of a "lazy" precompiler for C++ is briefly descri ...

M. Roberts

June 1989 **Proceedings of the 26th ACM/IEEE conference on Design automation**

Publisher: ACM Press

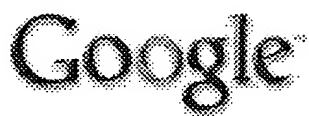

Full text available: [pdf\(369.84 KB\)](#) Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

The Electronic Design Interchange Format (EDIF) allows tools at all levels of the design process to exchange data. This paper describes an efficient method for reading incremental, hierarchical EDIF and the issues involved. The approach taken allows the data to drive the interpretation process by attaching functions to the EDIF keywords. The key to this approach is the representation and interpretation of the EDIF keyword semantics.
